

# Funder experimentation with AI

## EViR 22 January 2026

Tom Stafford, Senior Research Fellow

[t.stafford@researchonresearch.org](mailto:t.stafford@researchonresearch.org)

[tomstafford.github.io](https://tomstafford.github.io)

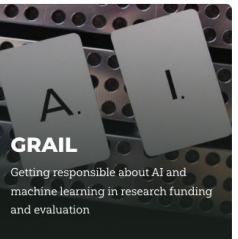

## 12 codesigned projects

**Matthew**  
A study of cumulative advantages in funding allocation

**Narratives**  
The uses and evaluation of researchers narrative CVs

**GRAIL**  
Getting responsible about AI and machine learning in research funding and evaluation

**Funder Data Platform**  
Supporting data-sharing to unlock insights into research funding

**AGORRA**  
A global observatory of responsible research assessment

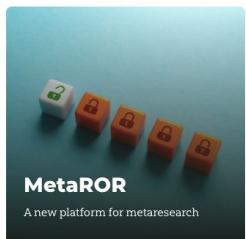

**Undisciplined**  
Future models of funding and evaluating transdisciplinary research

**Peer Review**  
RoRI Atlas of Peer Review

**Portfolios**  
Research funding landscape analysis

**MetaROR**  
A new platform for metaresearch

**AFIRE**  
Accelerator For Innovation & Research Funding Experimentation

## 19 Core Partners

# Our definition of experiment

**Principled:** a research design that allows inference about what causes what (before/after, shadow experiments, true experiment/RCT)

**Planned:** primary outcome measure and analysis plan declared in advance

**Public:** a commitment to sharing the results regardless of outcome

# We can plan/run experiments

# RoRI's GRAIL project

GRAIL = Getting responsible about AI and machine learning (ML) in research funding and evaluation

A RoRI project running from 2023 to 2025

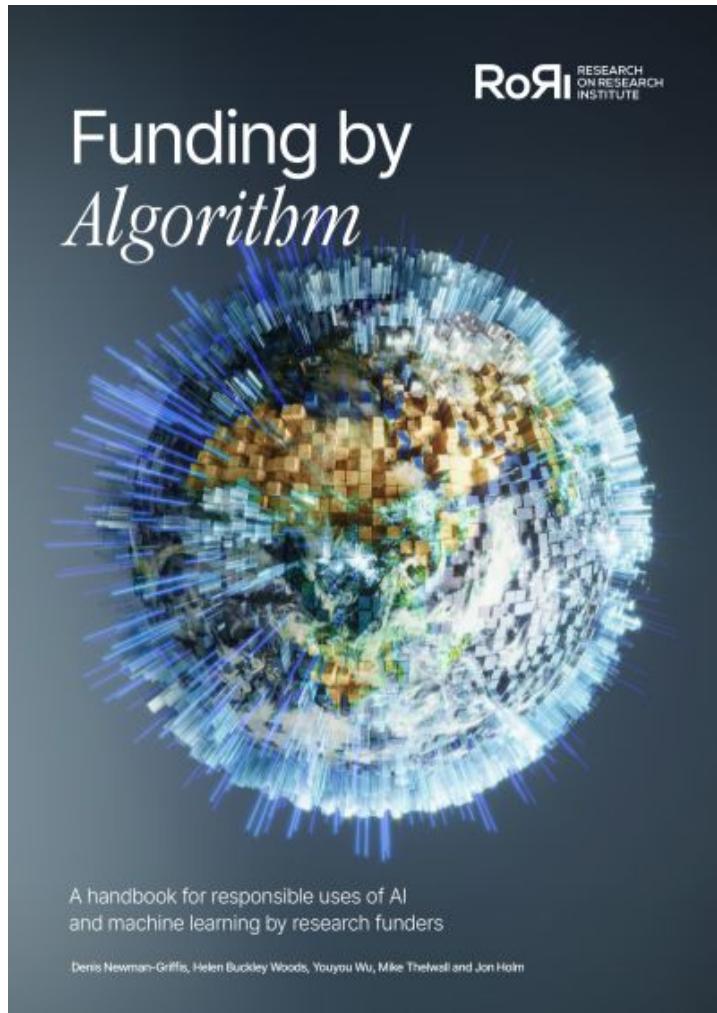

Goal: Understand how funders use AI/ML and build shared practices

Who:

- 35 delegates from 13 research funders
- 4 researchers

# Funding By Algorithm

A handbook for  
responsible uses of AI  
and machine learning by  
research funders

[\[link\]](#)

# Sprint v1.0 - 20 x N America and European funders

---

AI in reviewer matching	3.8
AI in peer reviewing	3.5
AI for prioritising funding applications	3.3
AI in research assessment exercises	3.2
AI for applicant self-assessment	3.2
AI for navigating funding resources	3.0
AI in strategic planning	2.8

# AI and Reviewer Matching in Research Funding: Three Case Studies

Inés Bouzón Arnáiz, Carla Carbonell Cortés, Alexander Hagemeijer, Anne Jorstad, Gabriel Okasa, Mike Thelwall, Niels van den Berg, Helen Buckley Woods

16/12/2025

Three case studies explore  
real-world approaches and  
trade-offs:

# AI reviewer matching@Metascience2025

## Research Questions

1. Can language models help match proposals to reviewers?
2. Is it feasible for something like a conference to adopt/adapt this technology?
3. Can it be done securely/privacy respecting?

Maybe - evidence for meaningful improvements beyond human matching

Definitely yes

Definitely yes

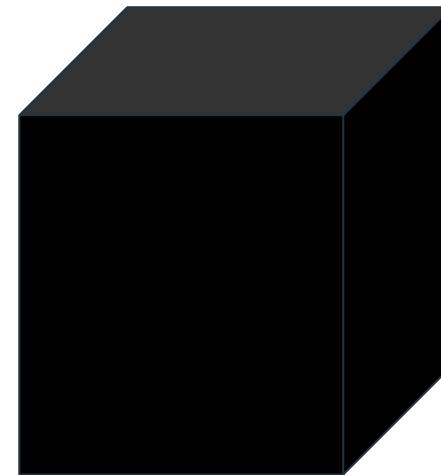

# Why AI specifically requires experiments

---

AI is novel & changing - our intuitions are poorly calibrated

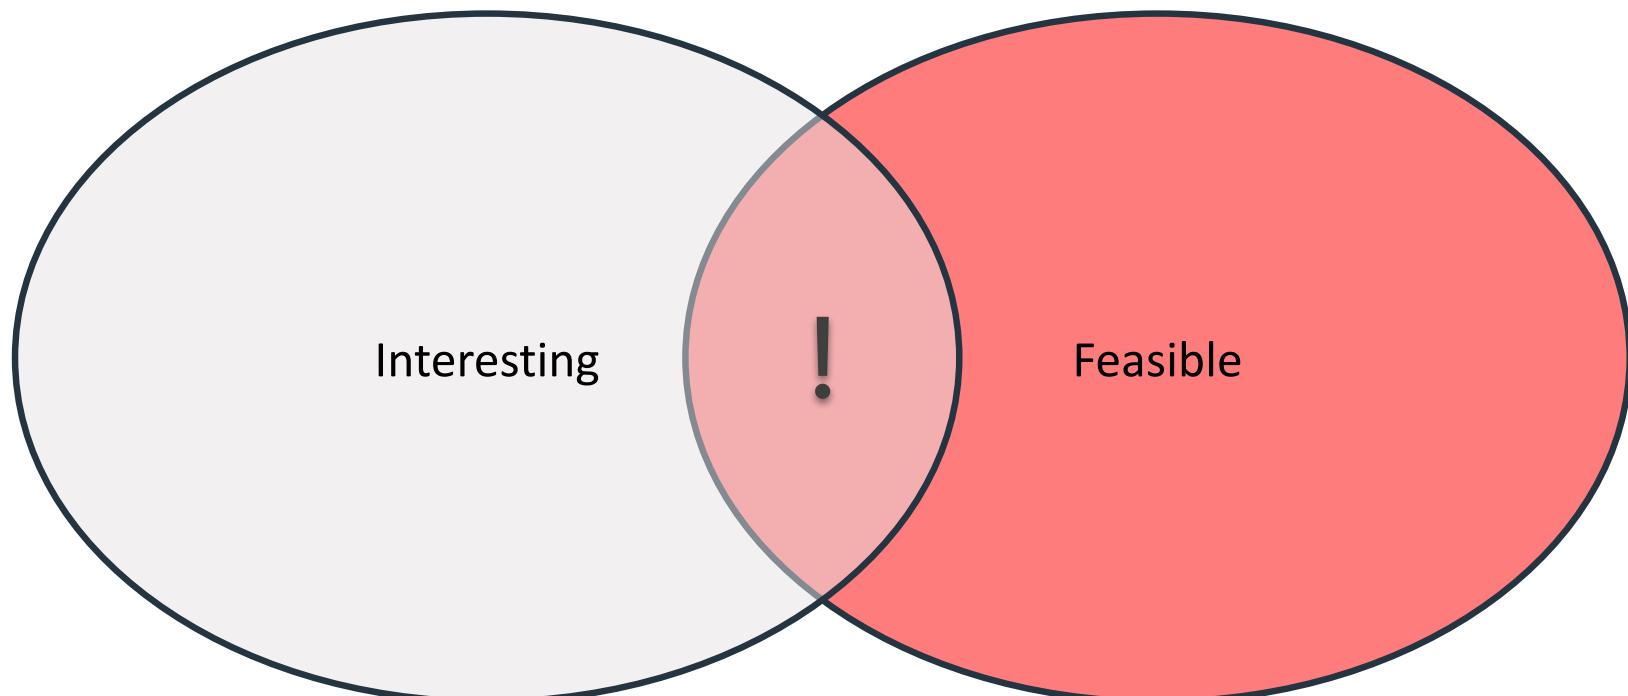

Specific areas of uncertainty

- Fluency
- Stochasticity
- Hallucinations
- Inscrutability
- Bias

# Thinking about experiments

“The Art of the soluble”

# Good outcome measures

---

A part of the fresco "Triumph of Galatea," created by Raphael around 1512 for the Villa Farnesina in Rome. [Art Images via Getty Images](#)

# Assays and microscopes

---

Yes/No

but is it the  
right  
question

Close view

but what are  
you looking for?

# Desk Rejection Shadow Experiment

Can agency staff predict those proposals with the least likelihood of success?

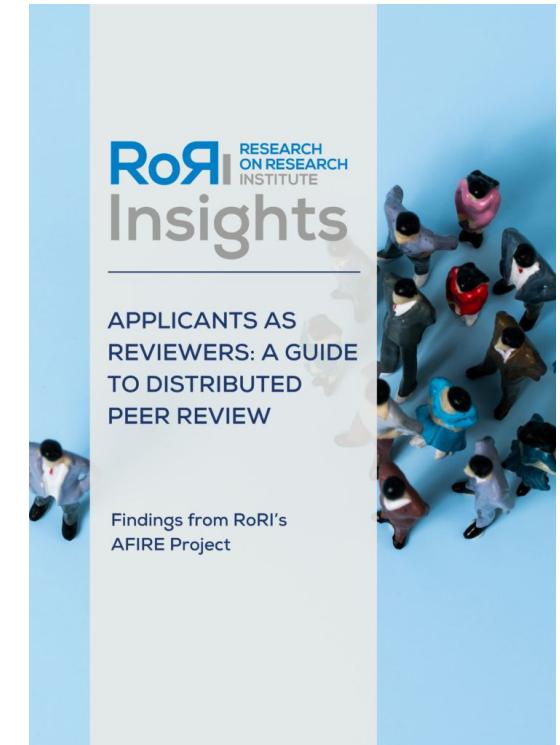

- a shadow experiment, not an intervention
- supports optimal use of external review
- UKRI leading participation
- recruiting schemes which will complete by end of 2026

# More on GRAIL & the GRAIL case studies

# GRAIL activities

---

**13 virtual workshops**

Presentations / case studies

Q&A

Group discussions

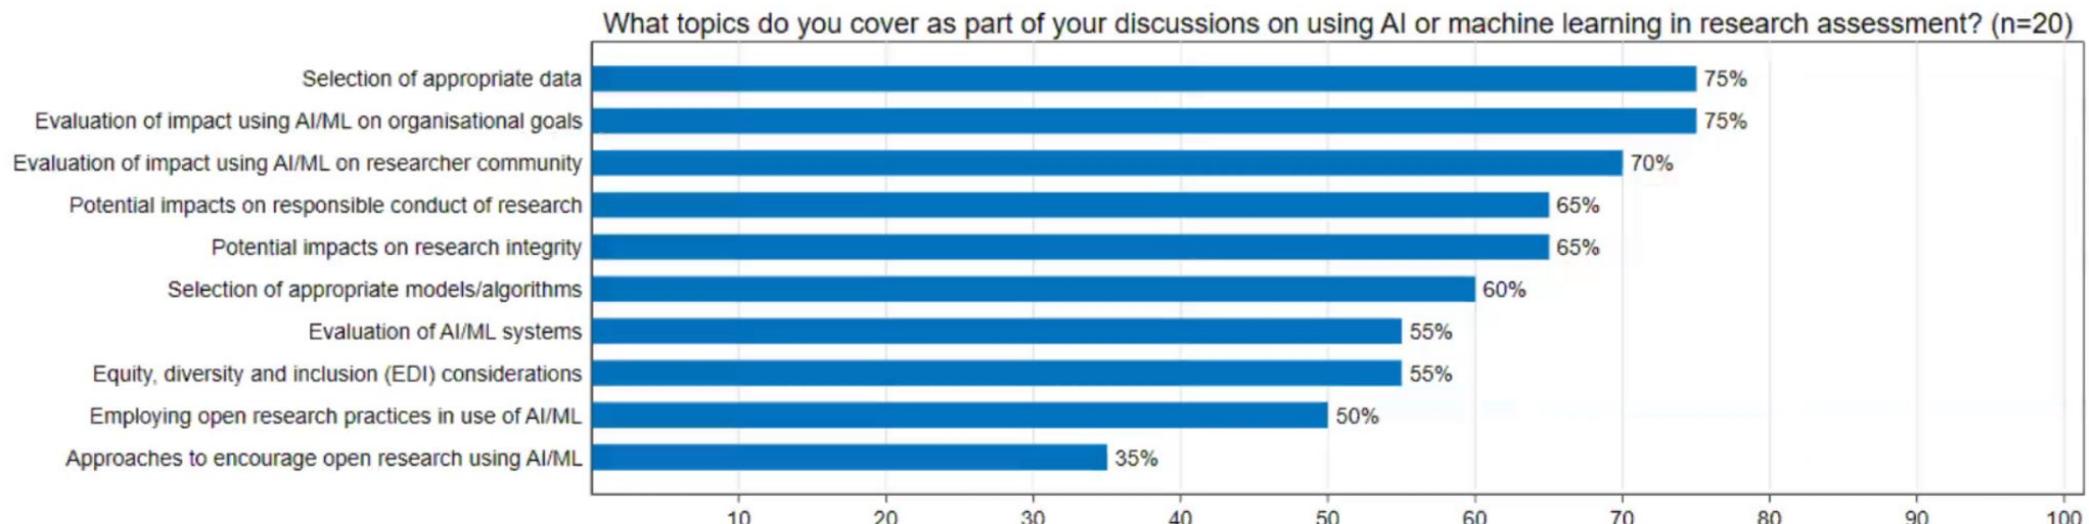

Topic
Guidelines for the use of generative AI in 7 research funding processes
Responsible AI principles for research 8 funders
9 Human in the Loop
Collaboration and reuse: tools, data, and 10 knowledge structures
Competencies and collaboration on AI/ML 11 applications
Impact assessment, documentation and 12 reporting, and transparency and reliability

# GRAIL outputs

---

A curated library of AI/ML use cases

Survey: experiences with AI/ML

# GRAIL insights: a wide range of AI use cases

---

Peer review

Handling applications

Tracking and evaluating research outputs

Assisting applicants

# GRAIL insights: AI use cases

---

## Peer review

- Matching proposals to reviewers [[Handbook case study 1](#)]
- Evaluating the quality of reviewers' comments
- Summarising and integrating reviewer comments

# GRAIL insights: AI use cases

---

## Handling applications

- Screening and prioritising applications [\[Handbook case study 2\]](#)
- Automatic tagging of proposals for topic/theme/SDGs
- Summarising / translating proposals
- Detecting duplicate / similar applications
- Verify eligibility

# GRAIL insights: AI use cases

---

## Tracking and evaluating research outputs

- Linking funded grant and research publications [[Handbook case study 3](#)]
- Linking funded grant and research impacts (patent/policy/media) [[Handbook case study 4](#)]
- Quality assessment of research publications [[Handbook case study 5](#)]

# GRAIL insights: AI use cases

---

## Assistance for applicants

- Chatbot for understanding funding calls
- Proposal writing assistant
- Proposal review assistant
- Self-evaluation of proposal

# GRAIL insights: evaluation and experimentation

---

GRAIL has seen some excellent examples of experiments (a few among the participants)

A few suggested areas for evaluation in the handbook

- AI in reviewer matching
- AI in producing peer review reports
- AI for prioritising funding applications
- AI in research assessment exercises
- AI for applicant self-assessment
- AI for navigating funding resources
- AI in strategic planning

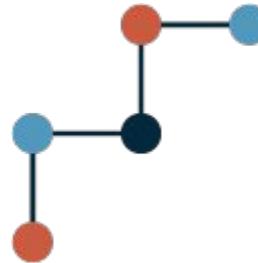

# GRAIL insights

---

More systematic experiments with AI/ML tools is needed

Small, focused experiments will help us move beyond anecdotes

Potential for multi-funder collaboration on experiments

# Swiss National Science Foundation

---

## Implementation

Since 2020 in the Life sciences (1000 proposals/year)

Fixed pool of reviewers

Full text of proposals

In house data team

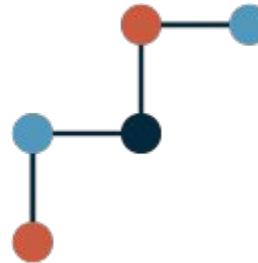

## Considerations

Human in the loop (all matches reviewed)

Explainability (not generative)

Transparency (open, not commercial models)

Privacy (run locally)

# Swiss National Science Foundation

---

## Evaluation:

Informal: time saving

Formal: overlap with human matching (“in more than 8 out of 10 proposals, there was at least one reviewer suggested by the AI-assisted reviewer matching that was also manually assigned by the scientific officers.”)

## Learnings

Demonstrate feasibility & efficiency \*as a supporting tool\*

Heterogeneity in performance

Integration with organisation requires as much attention/resource as technical implementation

Okasa, G., & Jorstad, A. (2024). The Value of Pre-training for Scientific Text Similarity: Evidence from Matching Grant Proposals to Reviewers. In Proceedings of the 9th edition of the Swiss Text Analytics Conference (pp. 89-101).

## "la Caixa" Foundation

---

### Implementation

Last 8 cycles of CaixaResearch Health call, also now Innovation call

Fixed reviewer pool

Co-designed/developed with external provider

Keywords (MeSH) from proposals sent to external provider, reviewer keywords obtained from pubmed, matches returned

### Considerations

Time/workload saving,

Accuracy/fairness

Population balance (e.g. gender assignment)

## "la Caixa" Foundation

---

### Evaluation

10% of matches reviewed by human

Audit of % of reviewers who declare a lack of expertise on assigned proposals (stable at 20% per year)

### Learnings

Successful for improving not replacing human intervention

Other uses of AI: detecting proposals with low probability of being funded, reviewing evaluators' comments, summarizing selected proposals to produce abstracts for the general public and summarizing evaluators' comments

## Implementation

Tool available organisation wide

[prophy.ai/](#) (previously Elsevier tool)

Proposals & applicant details uploaded,  
reviewer suggestions come back (no  
pool), used to augment existing reviewer  
search methods

## Considerations

Prophy driven by OA sources

Motivations: Speed, widen reviewer pool,  
improve match quality

## Evaluation

No formal evaluation - difficulties is assessing value for staff and in assessing quality of reviews resulting

## Learnings

tool won't tell you reviewer quality, or timeliness

perceived to be successful (a useful tool, better than keyword only search)

external party easier than in house development

# INSIDE THE FUNDING PROCESS: USING GENERATIVE AI TO ASSESS REVIEWERS' CRITERIA PRIORITISATION IN MULTI-STAGE APPLICATION ASSESSMENTS

PETER KOLARZ AND DIOGO MACHADO

DOI: 10.22163/FTEVAL.2025.710

Science Fund

# The Metascience 2025 conference experiment

Can AI be used for better matching  
of proposals to reviewers? Feasibility  
and formal evaluation with the  
Metascience 2025 conference

Josie Coburn and Tom Stafford 2025-11-26

Finding (enough, good) reviewers is a conceptual and practical problem

- conceptual: what makes a reviewer good?
- practical: how do you get a reviewer to agree?

Reviewer-proposal matching identified by GRAIL as a key area for possible experiments

Many funders already exploring this

Algorithms need validation!

# Meta-metascience

---

AFIRE Commitment: Observation is not enough - we have to try things!

- demonstrate feasibility
- opportunity for better causal inference

Metascience 2025 conference, London

- a chance to show we'll take our own medicine
- appropriate domain for demonstrating feasibility
- added value: validate by collecting reviewer self-perception of suitability

# The “shadow” experiment

---

Consent from those submitting and reviewers  
All analyses done after final programme decisions  
All analyses local - no data left the conference  
441 submissions: Title, Abstracts  
25 reviewers: assigned to submissions via keywords  
1,323 reviews

- for each we have a match scores & a reviewer suitability judgement
- (each proposal seen by 3 reviewers)

## Research Questions

1. Can language models help match proposals to reviewers?
2. Is it feasible for something like a conference to adopt/adapt this technology?
3. Can it be done securely/privacy respecting?

# Matching - via embedding

---

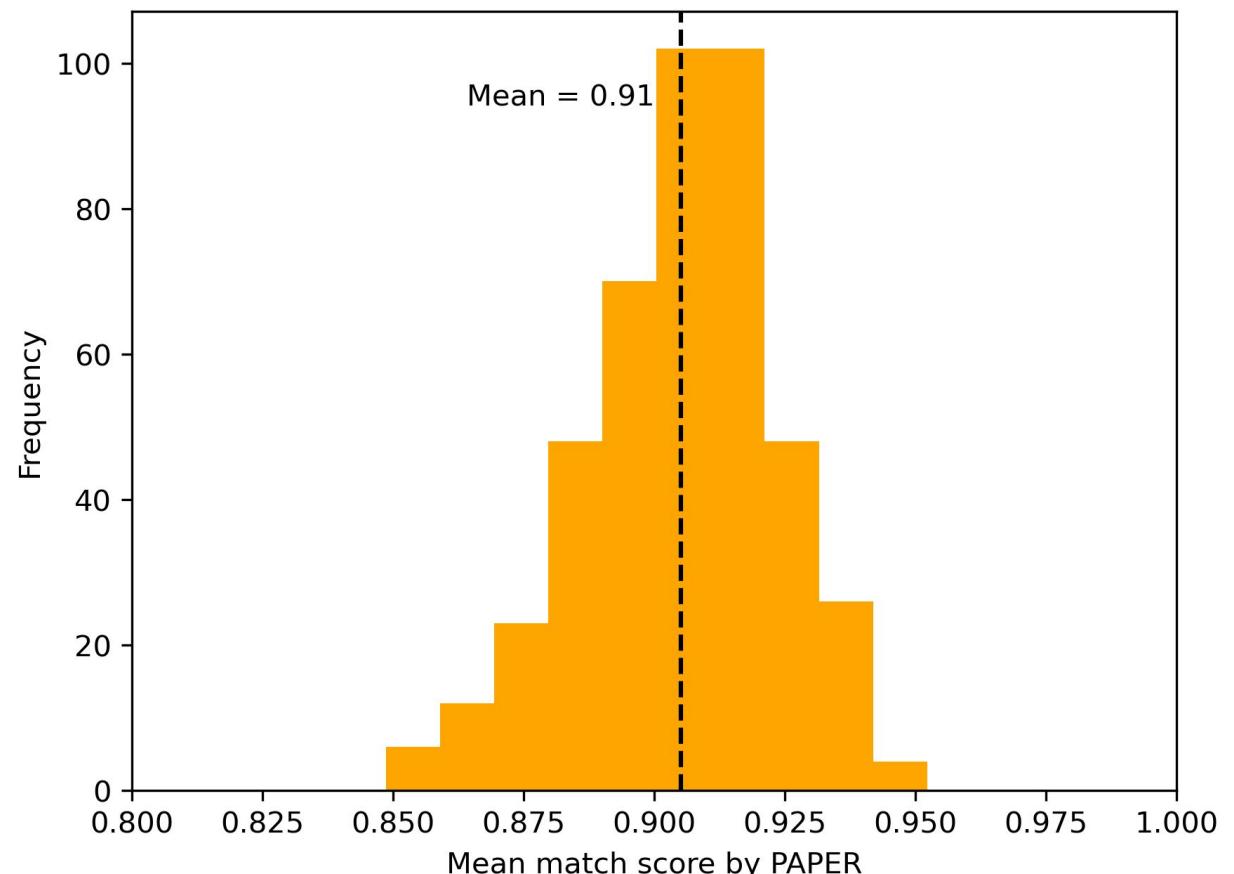

Reviewer keywords & proposal title+abstract -> embedding space

Code from SNSF:

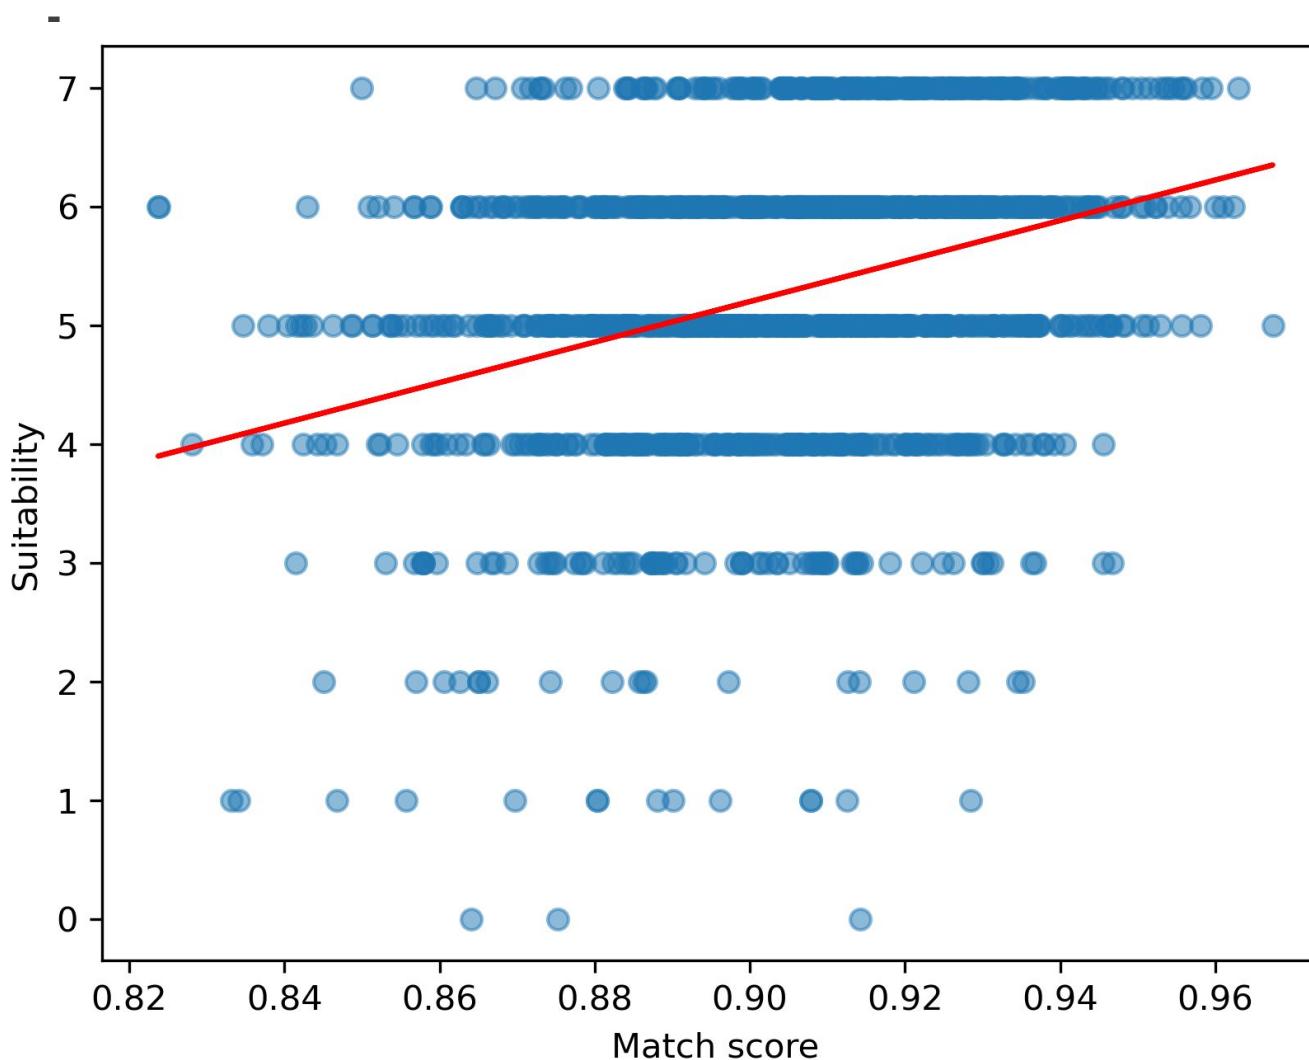

<https://github.com/snsf-data/snsf-grant-similarity>

- thanks to Gabriel Okasa and the SNSF data team!

Model: [SPECTER2: BERT model pre-trained on scientific texts and augmented by a citation graph](#)

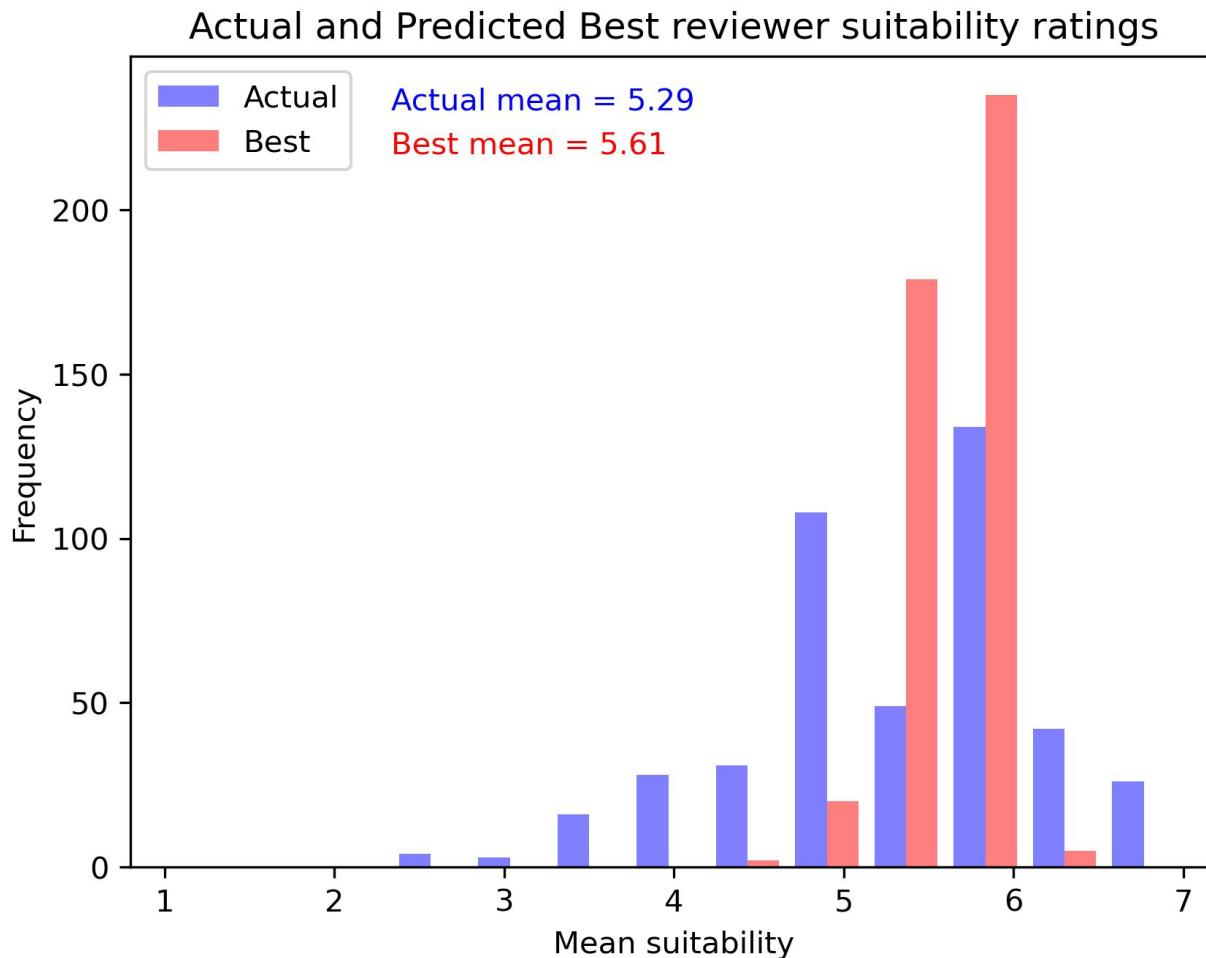

# You can predict suitability from match score

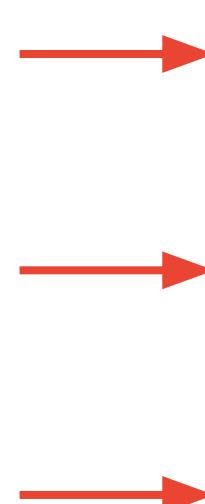

# ...and from this you can predict gain in suitability from using the optimal match

---

## Research Questions

1. Can language models help match proposals to reviewers?
2. Is it feasible for something like a conference to adopt/adapt this technology?
3. Can it be done securely/privacy respecting?

Maybe - evidence for meaningful improvements beyond human matching

Definitely yes

Definitely yes

**Thanks to all participants!**
